Present address: P.O. Box 140, Twain, CA 95984.

INTRODUCTION

My purpose is to make our creep data on San Francisco Bay region active faults available to the scientific research community. My student research assistants and I measured creep (aseismic slip) rates on these faults from 1979 until my retirement from the project in 2001. These data are further described in my final technical report as principal investigator, which summarizes results from 22 September 1979 through 28 February 2001 (Galehouse, 2001). We made over 2600 creep measurements, about one-third in the ten years prior to the Loma Prieta earthquake (LPEQ) and two-thirds in the 11.4 years following it. The measurements are continuing to be made by members of the Geosciences Department at San Francisco State University (SFSU) under the direction of Karen Grove and John Caskey. A complete analysis of our results obtained on the Hayward fault is presented in Lienkaemper, Galehouse and Simpson (2001). A formal report based on the entire San Francisco Bay region data set is in preparation.

METHODS

Amount of slip was determined by noting changes in angles between sets of measurements taken across a fault at different times. This triangulation method uses a theodolite to measure the angle formed by three fixed points to the nearest tenth of a second of arc (Galehouse and others, 1982). For the first 14 years of measurements, the angle was measured 12 times each measurement day. Since then, we have been measuring it eight times each day. The amount of slip between measurement days can be calculated trigonometrically using the change in average angle. The precision of the measurement method is such that we can detect with confidence any movement more than 1-2 mm between successive measurement days.

We have regular measurement sites at 29 localities on active faults, plus data from five sites that had to be abandoned. These site locations are shown as triangles and site numbers on the accompanying map (Figure 1) and identified by name in Tables 1 and 2A and in the data sheets. In addition to the sites in the San Francisco Bay region, we have one measurement site on the San Andreas fault in the Point Arena area and two on the Maacama fault in Willits and east of Ukiah. We typically have measured most sites with a history of creep about once every two months and most sites without any creep history about every three months.

In addition to our eleven regular sites on the Hayward fault, we have established 20 additional sites (shown by dots in Figure 1 and by name in Table 2B and in the data sheets) with J. Lienkaemper of the USGS. We began measuring each of these additional sites annually in July - August 1994.

DATA

Table 1 shows the least squares average rate of movement at each site determined using linear regression and the simple average determined by dividing the total net right-lateral displacement by the total time measured. All measurement sites span a fault width of 57-267 m, except Sites 8 and 20 that span a greater width because of site considerations. This fault width spanned is noted in Table 2 and represents the distance from the theodolite on one side of a fault (IS) to a target on the other side (ES). Table 2 also shows any changes in lengths during measurement history. Data sheets for each site follow Table 2. Each data sheet is identified in the upper left by site number and name and Hayward fault sites are ordered from northwest to southeast using kilometer distances along the fault measured from Point Pinole (P, in Figure 1) using the grid in Lienkaemper (1992). These data are also available for downloading in the Excel format to facilitate analysis of the data at <http://geopubs.wr.usgs.gov/open-file/of02-225/> (SFBayRegion.xls and HaywardFault.xls). They are also available as tab delimited raw data. The data include all regular measurement sites, SF-1 through SF-34 and the 20 SFSU and USGS afterslip sites on the Hayward fault.

ACKNOWLEDGMENTS

This project has been continuously funded since 1979 by various grants and contracts from the U.S. Geological Survey, National Earthquake Hazards Reduction Program (latest contract was 99-HQ-GR-0084). Special thanks go to the 23 student research assistants from San Francisco State University who have been instrumental in collecting these theodolite data since 1979. I am particularly grateful to Brett Baker, Beth Brown, Carolyn Garrison, Oliver Graves, Theresa Hoyt, Forrest McFarland, Carl Schaefer, and Jim Thordsen who each worked with me for more than three years. Thanks also to Bob Abrams, Chris Alger, Linda Bond, Denise Couthakis, Carolyn Domrose, Matt Harrigan, CJ Hayden, Kathleen Isaacson, Dan McVanner, Barbara Menne, Nicole Peirce, Brian Pierce, Holly Prochaska, Debra Smith, and Leta Smith who have all served as theodolite operators. Special thanks to James Lienkaemper of the U.S. Geological Survey for his help and encouragement over the years, including suggestions and thoughtful reviews of this manuscript. Reviews by R.W. Simpson and W. D. Stuart also improved the clarity of the map and text.
